

JcM Google reCAPTCHA V2 Phoenix V1.5

Updated to fix language file path error.

Updated to put all reCaptcha hooks into one file. Also place language files in correct path. Accept terms is still stand alone so add if required.

A simple add-on to let add the Google reCAPTCHA V2 and accept terms to any form in Phoenix 1.0.4.0 that has the hooks added to it.

It is a no core change add-on and uses site-wide hooks. Simply copy all the files over.

You will need your Google reCAPTCHA so you can add them to the following file

includes/languages/english/hooks/shop/siteWide/jcm_google_recaptcha.php

Just open it in your editor and add the comment and keys into it

```
//google
define('MODULE_CONTENT_RECAPTCHA_ERROR','Sorry you need to prove you are human first please
complete the google captcha');
define('MODULE_CONTENT_RECAPTCHA_SITEKEY','Place your site key here');
define('MODULE_CONTENT_RECAPTCHA_SECRETKEY','Place your Secret key here');
```

You can also define which pages it is shown on by editing the hook file.

```
$good_pages = ['contact_us.php', 'create_account.php'];
```

This is done in both the capatcha hook file JcMgoogleCapatcha.php

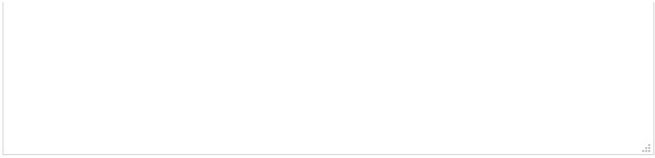

and the accept terms file JcMaTerms.php

That's it it should just work. When you go to your contact_us page you should see the Google reCAPTCHA and if installed the accept terms.

This will only work on Phoenix.

Enjoy.
